Abstract: Face is a complex multidimensional structure and needs a good computing techniques for recognition. Our approach treats face recognition as a two-dimensional recognition problem. In this scheme face recognition is done by Principal Component Analysis (PCA). Face images are projected onto a face space that encodes best variation among known face images. The face space is defined by Eigen face which is eigenvectors of the set of faces, which may not correspond to general facial features such as eyes, nose, and lips. The Eigen face approach uses the PCA for recognition of the images. The system performs by projecting pre extracted face image onto a set of face space that represents significant variations among known face images. Face will be categorized as known or unknown face after matching with the present database. If the user is new to the face recognition system then his/her template will be stored in the database else matched against the templates stored in the database. The variable reducing theory of PCA accounts for the smaller face space than the training set of face.

Keywords: Face Recognition, PCA, Eigen face, Eigen Vector.

I. INTRODUCTION

The Face is a complex multidimensional structure and needs good computing techniques for recognition. The face is our primary and first focus of attention in social life playing an important role in identity of individual. We can recognize a number of faces learned throughout our lifespan and identify that faces at a glance even after years. There may be variations in faces due to aging and distortions like beard, glasses or change of hairstyles. Face recognition is an integral part of biometrics. In biometrics basic traits of human is matched to the existing data and depending on result of matching identification of a human being is traced. Facial features are extracted and implemented through algorithms which are efficient and some modifications are done to improve the existing algorithm models. Computers that detect and recognize faces could be applied to a wide variety of practical applications including criminal identification, security systems, identity verification etc. Face detection and recognition is used in many places nowadays, in websites hosting images and social networking sites. Face recognition and detection can be achieved using technologies related to computer science. Features extracted from a face are processed and compared with similarly processed faces present in the database. If a face is recognized it is known or the system may show a similar face existing in database else it is unknown. In surveillance system if an unknown face appears more than one time then it is stored in database for further recognition. These steps are very useful in criminal identification. In general, face recognition techniques can be divided into two groups based on the feature representation they use appearance-based, which uses holistic texture features and is applied to either whole-face or specific regions in a face image and feature-based, which uses geometric facial features (mouth, eyes, brows, cheeks etc), and geometric relationships between them.

II. PRINCIPAL COMPONENT ANALYSIS

Following Diagram shows the Face Recognition System with Principal Component Analysis.

A. Face Image Representation

Training set of m images of size $N \times N$ are represented by vectors of size $N_2$.

Each face is represented by $\Gamma_1, \Gamma_2, \Gamma_3, \ldots, \Gamma_M$.

Feature vector of a face is stored in a $N \times N$ matrix. Now, this two dimensional vector is changed to one dimensional vector.

For Example: $\begin{bmatrix} 1 & 2 \\ 1 & 2 \end{bmatrix} = \begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$

Each face image is represented by the vector $\Gamma_i$

$\begin{bmatrix} -1 \\ -2 \\ -3 \end{bmatrix}, \begin{bmatrix} 1 \\ 3 \\ 1 \end{bmatrix}, \begin{bmatrix} 3 \\ -1 \\ 2 \end{bmatrix}, \begin{bmatrix} -2 \\ 3 \\ 1 \end{bmatrix}$, $\ldots$, $\begin{bmatrix} 1 \\ 2 \\ 1 \end{bmatrix}$

B. Mean and Mean Centered Images

Average Face Image is calculated by

$\Psi = \frac{1}{M} \sum_{i=1}^{M} \Gamma_i$  \hspace{1cm} (1)

<Figure 1: Block Diagram of Face Recognition with PCA>
\[
P = \frac{1}{M} \sum_{i=1}^{M} \left( \frac{Y_i}{\|Y_i\|} \right)
\]

Each face differs from the average by
\[
\phi_i = Y_i - \psi
\]
This Image is called mean centred image.
\[
\phi_1 = \begin{bmatrix} 2 \\ -1 \\ -1 \\ 0 \end{bmatrix}, \phi_2 = \begin{bmatrix} 2 \\ 4 \\ -3 \\ 5 \end{bmatrix}, \phi_3 = \begin{bmatrix} 3 \\ -2 \\ -4 \\ 6 \end{bmatrix}, \ldots \phi_M = \begin{bmatrix} 2 \\ 3 \\ 0 \\ 4 \end{bmatrix}
\]

C. Covariance Matrix
A covariance matrix is constructed as:
\[
C = AA^T \text{ whr } A = \left[ \phi_1, \phi_2, \ldots, \phi_M \right] \text{ of size } N^2 \times N^2
\]
\[
A = \begin{bmatrix} 2 & -1 & -2 \\ -1 & 1 & 2 \\ -2 & 1 & 3 \\ 0 & 2 & 2 \end{bmatrix} \quad A^T = \begin{bmatrix} 2 & -1 & -1 & 0 \\ -1 & -1 & 0 & 0 \\ 1 & -1 & 1 & 0 \\ 0 & 2 & 1 & 2 \end{bmatrix}
\]
Size of covariance matrix will be N x N (4x 4 in this case). Eigen vectors corresponding to this covariance matrix is needed to be calculated, but that will be a tedious task therefore, for simplicity we calculate \(A^T A\) which would be a 2 x 2 matrix in this case.
\[
A^T A = \begin{bmatrix} 1 & 2 \\ 2 & 1 \end{bmatrix}
\]
size of this matrix is M x M.
Consider the eigenvectors \(v_i\) of \(A^T A\) such that,
\[
A^T A v_i = \lambda_i v_i
\]
The eigenvectors \(v_i\) of \(A^T A\) are X1 and X2 which are 2 x 1. Now multiplying the above equation with A both sides we get,
\[
AA^T X_i = \lambda_i X_i
\]
\[
AA^T (AX_i) = \lambda_i (AX_i)
\]
Eigen vectors corresponding to \(AA^T\) can now be easily calculated now with reduced dimensionality where \(AX_i\) is the Eigen vector and \(\lambda_i\) is the Eigen value.

D. Recognition Steps
The test image, \(\Gamma\) is projected into the face space to obtain a vector, \(\Omega\) as
\[
\Omega = U^T (\Gamma - \psi)
\]
The distance of \(\Omega\) to each face is called Euclidean distance and defined by
\[
\epsilon_k^2 = \| (\Omega - \Omega_k) \|^2 \quad \text{whr } k = 1, 2, \ldots, M
\]
Where \(\Omega_k\) is a vector describing the kth face class. A face is classified as belonging to class k when the minimum \(\epsilon_k\) is below some chosen threshold \(\Theta_c\). Otherwise the face is classified as unknown.
\[
\Theta_c = \frac{1}{2} \max j, k \| \Omega_j - \Omega_k \|
\]
We have to find the distance \(\epsilon\) between the original test image \(\Gamma\) and its reconstructed image from the Eigen face \(\Gamma^r\).
\[
\epsilon^2 = \| (\Gamma - \Gamma^r) \|^2 \quad \text{whr } \Gamma^r = U \ast \Omega + \psi
\]
3. Now Next step is to convert Colour image form Colour to Grayscale.

![Image](image1)

4. Next step is to find Mean centred Image.

![Image](image2)

5. Now Next Step is to find Eigen Faces of the Train Database.

6. Chart of Euclidian Distance of each and every image of train database for Matching.

<table>
<thead>

</table>

7. On the basis of Euclidean Distance we just find which image from training data base is closest to the test image. In above table IMAGE NO 14 having low Euclidean Distance so that IMAGE NO 14 is closest to the Test Image. Following image is a match for Input Test Image.

IV. MATLAB IMPLEMENTATION

Matlab Implementation of Face Recognition with PCA is shown below.

![Image](image4)

By
Ms. Shamita Patil
Ms. Shital Ingale
Ms. Harshali Jagtap

Under the Guidance of
Mr. Arjun R. Nichal

Fig.2. Main GUI of PCA
This GUI is used for storing image of new user to the database. Webcam is used for real time streaming of video. After clicking on Capture button frame is captured and displayed in respective axis, then this frame is saved in folder database with the help of Save in database button.

V. CONCLUSION

The face recognition is an upcoming area. There are lots of potentials scenarios where it can be used. Considering this is not completely reliable to be used as an independent technique for an authentication. Face recognition may be thrown out of the gear with plastic surgery, so it might need to be combined with other technologies such as iris scan to improve reliability. With improvement in tools and technologies, it only a matter of time before the incidence of false identification of subjects is reduced to an acceptable level to make face recognition more useful.
